Inquiry

Linagliptin is a caffeine and quinazoline derivative that inhibits dipeptidyl peptidase 4 (DPP-4). This mechanism only has a positive effect on type 2 diabetes. The medicine was developed by Boehringer Ingelheim. Linagliptin, unlike other gliptines, can also be given with less renal function. In addition, animal studies indicate that it is significantly more potent than its derivatives and has a very long, dose-independent, half-life.

Description

Formula	C ₂₅ H ₂₈ N ₈ O ₂
Molecular weight	472.50 g/mol
Molecular size	small
Controlled Substance	no
Precursor	no
Indications	Drugs used in diabetes
