

Raloxifen hydrochloride

CAS

82640-04-8

Status

Commercial

[Inquiry](#)

Raloxifene hydrochloride is a synthetic, nonsteroidal, selective estrogen receptor modulator. It is used to treat and prevent osteoporosis in postmenopausal women. There is evidence that Raloxifene additionally reduces the risk of breast cancer and has a positive effect on the cardiovascular risk of postmenopausal women. In 2018, a meta-analysis showed that it can also noticeably reduce the symptoms of schizophrenia. Dose adjustment is not necessary in the elderly, which is why it is suitable for long-term treatment.

Description

Formula $C_{28}H_{27}NO_4S \cdot HCl$

Molecular weight 510.04 g/mol

Molecular size small

Controlled Substance no

Precursor no

Indications Sex hormones and modulators of the genital system
