

# Epinephrin

CAS

51-43-4

Status

Commercial

Inquiry

Epinephrine is also known as adrenaline and is a human hormone that is chemically part of the catecholamines. The stress hormone is involved in stress reactions and therefore increases performance. This is achieved via faster energy release, heartbeat rate, tighter bloodvessels and broncholic enlargement.

## Description

### Formula

C<sub>9</sub>H<sub>13</sub>NO<sub>3</sub>

### Molecular weight

183.20 g/mol

### Molecular size

small

### Controlled Substance

no

### Precursor

no

### Indications

Stomatological preparations, Antihemorrhagics, Cardiac therapy, Drugs for obstructive airway diseases, Ophthalmological drugs
